Political Discontent and Regime Instability: Complete Model Results Compendium

All estimated models, 2026-07-14/15 analysis round (internal working document)

2026-07-15

Table of contents

1 Reading guide 1

2 Main models: fully specified RoW regime-transition hazard 1

3 Cross-operationalization robustness (5 instability measures) 4

4 Specification robustness: period dummies and cubic duration 5

5 ERT reg-trans models (interaction and main-effect versions) 7

6 Cox regime-survival models 10

7 GWF and Powell-Thyne supplementary models 10

8 Mobilization channel (auxiliary DV: V-Dem mass mobilization) 12

9 Superseded: V-Dem democracy-level DV (retained for the record) 14

1 Reading guide

This compendium collects **every model estimated** in the current analysis round, organized from the paper's main specification outward to robustness and superseded models. Throughout: `disc_c` = political discontent (centered, lagged), `supp_c` = democratic support (centered, lagged), `disc_supp` = their interaction; **MOC** = method of composition across 900 paired posterior draws (measurement uncertainty of discontent, support, and V-Dem propagated); **naive** = same model on posterior means. Firth = penalized likelihood for rare events.

Headline pattern. Under naive estimation, discontent (autocracies, $p = .046$), its interaction with support (autocracies, $p = .050$), and democratic support (democracies, $p = .037$) appear significant; under MOC all attenuate toward zero and lose significance. Interaction signs are theory-consistent in every specification (democracies −, autocracies +) but never significant. Controls (regime tenure, GDP, resource dependence) are significant and stable under both estimators.

2 Main models: fully specified RoW regime-transition hazard

DV = change in Regimes-of-the-World category (lead-coded); discrete-time hazard; full control set (log GDP, growth, regional democracy, %Muslim, resource dependence, log regime tenure, prior transitions, income inequality, log population).

9 Superseded: V-Dem democracy-level DV (retained for the record)

The liberal-democracy *level* DV measures democratic quality/erosion, not regime stability, and was replaced (JC decision) by the transition/survival DVs above. Reported for completeness.
