
Full control specification throughout; 'in autocracies/democracies' rows split the opinion slopes by regime type (zero−filled regressors).
For regime−transition rows the in−autocracies slope is the democratization side, the in−democracies slope the breakdown side.
Democracy−level rows: pooled OLS, coefficients x1000. Transition rows: Firth penalized logit. Subsample, direction−specific, plain−logit, and exploratory GWF variants: appendix tables.
